### **What Is The Difference Between A PC And A MAC?**

Different programming, different operating systems, different overall functions. It is not hard to use a Mac, just different. Different key commands, format and appearance. Kind of like learning a new language; it is not worse, just different from what you may use now. PC is one language and Mac is another. Macs are very user friendly in that everything is really right in front of you. If you are looking for just a standard-use computer just go with a PC. I say that because Macs are more difficult to get repaired and you cannot get upgrade parts or software from anywhere but Macintosh and they are expensive. If you want a good, dependable computer for a decent price, go with a Dell which is the best pre-built PC on the market at the moment. The geeks will say the Mac has fewer viruses and less crashes. They tend to last longer as well although the gap is closing on the variances every year. You can boot up a Mac in PC format and many PC applications can be run on a Mac but not the opposite. The choice is up to you. Most businesses use PC. Most music and graphic artists use a Mac.

### **Keyboard Bumps:**

Look down at your keyboard and locate the letters F and J. It may be a little hard to see, but those two letters happen to have a little "bump" on them. It's just a little line that goes across the key that sticks up. The two bumps are there to help you position your hands on the keyboard in the correct places without having to look down. All you have to do is feel around for those two bumps and your hands will be in the correct position for the ultimate typing experience.

### **How To Print A List Of All The Hardware On Your Computer:**

Have you ever wondered what your entire computer has in terms of hardware? I'm talking about everything from the motherboard to ports to controllers to drives. You can do this through your computer's DEVICE MANAGER. To open the Device Manager, right click on the MY COMPUTER icon on your desktop and choose PROPERTIES. From there, click on the HARDWARE tab and then the DEVICE MANAGER. You will then see a list of all the services on your system. Click on one of the items then go up to the ACTION menu and press Print. You can choose from a very detailed list or just a summary. When the print job is done, you will probably have multiple pages. Mine was 19.

**Next issue:** Marketing products and services online.
